

The diagram represents a UML (Unified Modeling Language) class diagram. It visualizes the structure of a software system by showing classes, their attributes, methods, and relationships for a user and every process a user should follow while using a habit tracking application.

. The diagram contains six classes:

- **User:** Represents users of the system.
 - Attributes: id (integer), name (string), email (string), password (string).
 - Methods: addHabit(), removeHabit(), etc.
- **Habit:** Represents habits.
 - Attributes: id (integer), title (string), habitDescription (string).
 - Connected to the Streak class via an association line.
- **Task:** Represents tasks.
 - Similar structure to Habit with its own attributes and methods.
- **Reminder:** Represents reminders.
 - Similar structure to Task but includes methods specific to reminders (e.g., setReminder(), cancelReminder()).
- **Streak:** Connected to Habit via an association line.
- **Notification:** Connected to other classes (details not specified).

Association lines indicate relationships between classes:

- User has a relationship with Habit, Task, and possibly other classes.
- Habit is associated with Streak.
- Tasks are associated with Habit.
- Reminder is associated with Task.
- Multiplicity markers (e.g., 1...*) indicate the number of instances related (e.g., one User can have multiple Habits).

The purpose of the system depicted in the UML class diagram is to manage habits, tasks, and reminders for users. Users can define and track their habits (e.g., exercise, reading, meditation). The Habit class represents individual habits, storing information such as habit titles and descriptions. The associations between classes (e.g., User-Habit, Habit-Streak) depict relationships and interactions within the system.

In summary, this system aims to help users organize their habits, tasks, and reminders efficiently. Users can create, track, and receive notifications related to their habits and tasks.
